CLINICAL USER GROUP MEETING 2018

Augment your Pathology

Whole Slide Imaging (WSI) with Quantitative Image Analysis (QIA) has rapidly augmented clinical pathology while providing new tools for both clinical and research applications.

How can the future of pathology be augmented?

This is one of many questions, which will be addressed during the meeting by users of quantitative image analysis and leaders of quality assurance schemes. The Visiopharm team will do their best to highlight the trends and describe the future of digital technologies including the expected capabilities of the new Deep Learning technology as a short-term example. Several new tools and methods will be presented, which can augment tissue diagnostics and tissue-based clinical research now and in the future,

To incorporate feedback from the 2017 meeting a parallel exhibition will be open during both days. This exhibition will show the newly launched augmentations from Visiopharm and from our many solution partners. For IT-specialists and technicians, there will be a hands-on session and discussion of digital standards and methods of implementation.

You can pre-submit slides for analysis in advance, please send to hfi@visiopharm.com
